

WYCLIFFE FUZZ V2

HOW DOES IT WORK?

Volume - Controls the output level.

Gain - Controls the amount of distortion in the circuit. Turn it to the left to clean up your signal.

Tone - A typical tone control. To the left darkens your tone, and to the right brightens.

Voltage - When all the way to the right, the circuit gets full power. Simulate a dying battery for other interesting tones by turning the knob to the left.

Tone Stack - When flipped **down**, this engages the tone knob as normal. When flipped **up**, the tone knob is bypassed, restoring the midrange and boosting the volume.

POWER REQUIREMENTS

9V Center Negative - Using anything else will ruin your pedal and void the warranty. Consumes 43 mA.
